

alternator

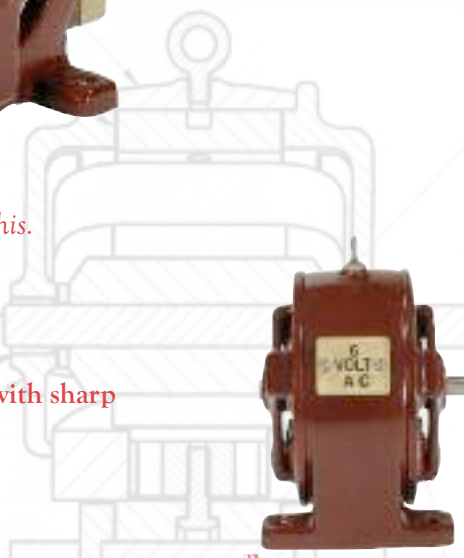

As an alternative to the ready to run dynamo, we are pleased to offer the Experienced Model Engineer a serious challenge in the form of a genuine open frame Alternator.

The kit comprises; castings, raw materials and drawing pack

Our own prototype produces 6v. a.c. @ 2600 r.p.m. but has the potential with adjustment to the internal coil/magnetic clearances to exceed this.

So now its over to you!

Please be aware that this kit contains a number of small items and materials with sharp edges which may present a hazard.

We sincerely hope you enjoy the challenge set by this kit
